## Instructions to run

Open the extracted folder in VS Code, using the “Live Server” extension to run the game. Once the server starts, the game will open automatically in your default browser.

## Instructions to use

The game will start from the initial state where you need to do the following actions:

- Type the name you want (the game is already waiting for that text input);
- Click on one of the balloons in the park whose back panel says "PLAYER";
- Click on one of the balloons in the park whose back panel says "OPONENT";
- Click on one of the white balls that will be positioned at the beginning of the circuit.

If all these actions have been done, click on the button that says "START", present in the central panel. If any of the previously mentioned actions have not been completed, clicking the "START" button will have no effect.

Assuming that clicking the "START" button was successful, the game will begin. To move your balloon you have the following options:

- Click the up arrow key to move up;
- Click the down arrow key to move down.

If you want to pause or unpause the game, click the "SPACE" key. If you are in doubt about the current state of the game, this information will be available on the central panel.

The game ends when the time runs out, but if you want to end it sooner you can click the "ESC" key.

When the game ends, the central panel will indicate who won. By clicking the "RESTART" button, the game will restart with the choices made previously, that is, the same name, side of the circuit and balloons. By clicking on "HOME" you will return to the initial state, meaning you can redo your choices.
